

A classic car club where members pay a fee to belong and can book out various classic cars for up to 5 days is developing a database to replace its existing paper-based records system. The customer's membership fee is translated into club points. The database needs to record **members** by their **unique membership number**, **name**, **address**, **date of birth** and **club points**. The system needs to record **bookings** of cars with a **unique booking id**, a **start date** and a **number of days**. The cars available to members need to be put in the database. Each **car** has a **registration number**, **make**, **model**, **mileage** and **band**. When a booking is complete the system should store the **invoice information** which should show the **end date of the booking** and the **cost of the car** in club points.
